# Stop Attackers
Before They Stop Your Business

- Agentless
- Noiseless
- Scalable
- Self-managing
- Risk-aware

Most organizations invest more each year in security technologies, frameworks, and cyber talent, yet devastating cyber incidents still occur. Attackers—whether outsiders or trusted insiders—can move silently for weeks or months. They use connectivity created by the business itself, until they're within striking distance. It then takes only seconds to compromise sensitive data, disrupt critical services, or steal money or IP. **With Illusive, these attacks can be stopped long before a business crisis occurs.**

Illusive disarms attackers immediately upon entry by eliminating their ability to decide how, where, and when to move through your network.

What can I learn from here?

Where can I go?

How can I get there?

POINT OF ENTRY

To determine how to navigate a network, attackers use data found on the endpoints they occupy. Starting from the vantage point of the attacker, **Illusive enables security teams to preempt, detect, and respond efficiently to stop cyberattacks by stopping lateral movement.**

illusive

PREEMPT

Keep your environment clean of the attackers need to move forward.

Every day, as employees routinely use applications and share data, they leave behind an invisible "access footprint"—credentials and connections to other systems. Illusive's Attack Surface Manager enables defenders to define credential and connection rules, and perpetually discover and remove violations.

DESIGN

Illusive Deception Management System

MANAGE

DEPLOY
*Machine learning and automation manage a tailored, scalable web of deceptions*

DETECT

Detect early by forcing attackers to reveal themselves.

Once they're in, adversaries search for data, credentials and paths to their targets. Illusive blankets the entire environment with featherweight deceptions that distort the attacker's view of reality, making it impossible for them to choose a real path. With one erroneous move, the attacker sounds an alert. The defender is now in control.

RESPOND

Empower defenders with real-time forensics and risk-centric visibility.

As an alert fires, forensics are instantly captured from the host where the attacker is operating, including a screenshot of the attacker's current activity. Responders receive a human-readable incident report and see how far the attacker is from critical assets and high-powered credentials. Responders have the risk context they need to prioritize and act efficiently to minimize business impact.
Illusive forensics preserves volatile system data

Contact us

Illusive Networks is a leader in deception-based cybersecurity solutions, empowering security teams to take informed action against high-impact cyberattacks by inhibiting and detecting the lateral movement of adversaries toward critical assets early in the process to prevent damage to the business.
